GSO 2 inch coma corrector for Newtonian telescopes for observation and astrophotography

The 2" coma corrector from GSO improves the field sharpness of Newtonian telescopes and is designed for observation and astrophotography

- Suitable for Newtonian telescopes with focal ratios from f/4 to f/6
- Suitable for 2" focusers
- Generous working distance of 75 mm from the M48 thread
- No change of the focal length
- 2" adapter for observation and reduction to T2 is included in the scope of delivery
- 2" filter thread at the telescope side

Manufacturer: GSO Guan Sheng Optical (https://www.teleskop-express.de/en/gso-guan-sheng-optical)

Coma corrector for Newtonian telescopes with 2" focuser

The inexpensive corrector from GSO is suitable for all Newtonian telescopes with a focal ratio of f/4 or higher. It improves the field sharpness by correcting the Newtonian coma. This effect distorts the stars at the edges. The corrector can be used visually and photographically.

The connection to the telescope

The corrector fits all Newtonian telescopes with a 2" focuser. You will have no problems reaching the focus. The corrector does not change the focus position and the original focal length remains the same.

Camera connection for astrophotography

The corrector has an M48x0.75 thread on the camera side. The working distance from this thread is 75mm. To reach the standard distance of 55 mm, a 20 mm extension (TSVF220) is required. In addition, an adapter from M48 to T2 is supplied for adapting cameras with the T2 adapter.

Connecting eyepieces for observation

The scope of delivery also includes a 2" receptacle for eyepieces. Especially long focal length eyepieces can be combined well with the corrector, the star sharpness at the edge will be improved.
